

The Tealium Android Library can:

- Take input in any order after an instance initializes.
- Non-track methods may be called from any thread and will be re-routed to Tealium's own background queue.

* Options within the Configuration can NOT be overwritten by remote options
 ** Multiple instances capable, all accessible through the multi-ton Tealium object
 *** Example of option that can be added via TIQ Setup
 **** Use either the TIQ Collect Tag, or the native Collect Dispatch Service (duplicate calls if both enabled)
